### 3.2. Power Sequence

To prevent the device damage from latch up, the power ON/OFF sequence shown below must be followed.

Power ON: VDD, DGND → VDDA, AGND → V1 to V14

Power OFF: V1 to V14 → VDDA, AGND → VDD, DGND

In order to prevent ILI6122 from power ON reset fail, the rising time ( $t_{POR}$ ) of the digital power supply VDD should be maintained within given specifications. The power ON/OFF timing sequence is illustrated as below:

*Note: For prevent anormal operation,  $t_{RST}$  must be longer than  $10\mu s$  during Power ON sequence.*

Luminance Uniformity	ΔL		75	80	-	%	1.2		

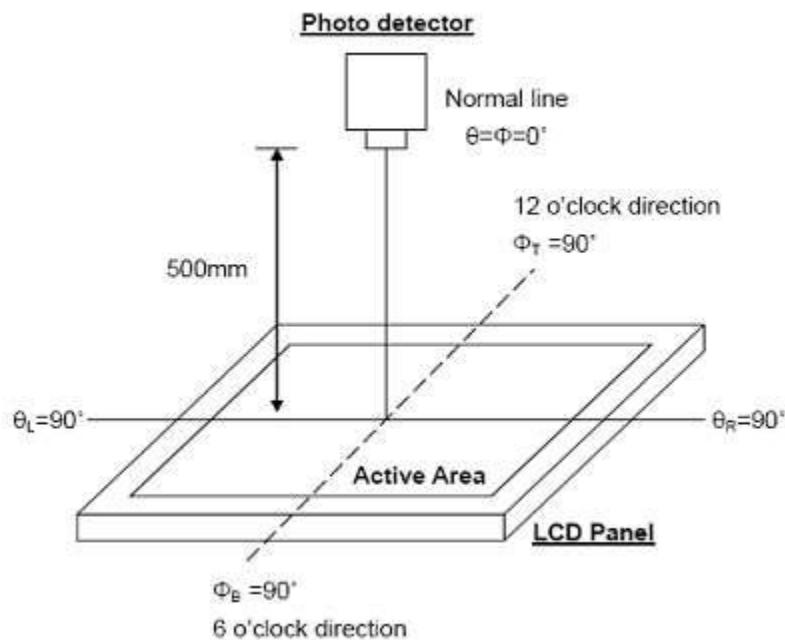

Note: The parameter is slightly changed by temperature, driving voltage and material

Note 1: The data are measured after LEDs are turned on for 5 minutes. LCM displays full white. The brightness is the average value of 9 measured spots. Measurement equipment BM-7 (Φ8mm)

Measuring condition:

- Measuring surroundings: Dark room.
- Measuring temperature: Ta=25°C.
- Adjust operating voltage to get optimum contrast at the center of the display.

The measured value is more than 5 minutes at the center point of the LCD panel, and the backlight is turned on at the same time.

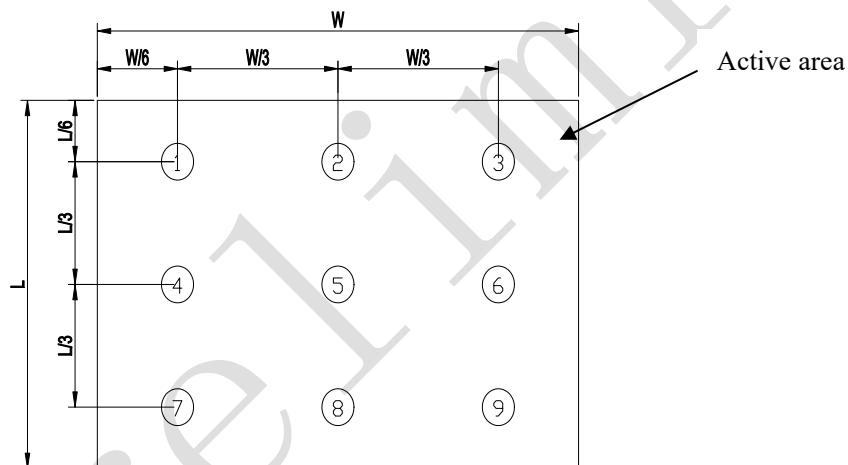

Note 2: The luminance uniformity is calculated by using following formula.

$$\Delta B_p = B_p (\text{Min.}) / B_p (\text{Max.}) \times 100 \text{ (%)}$$

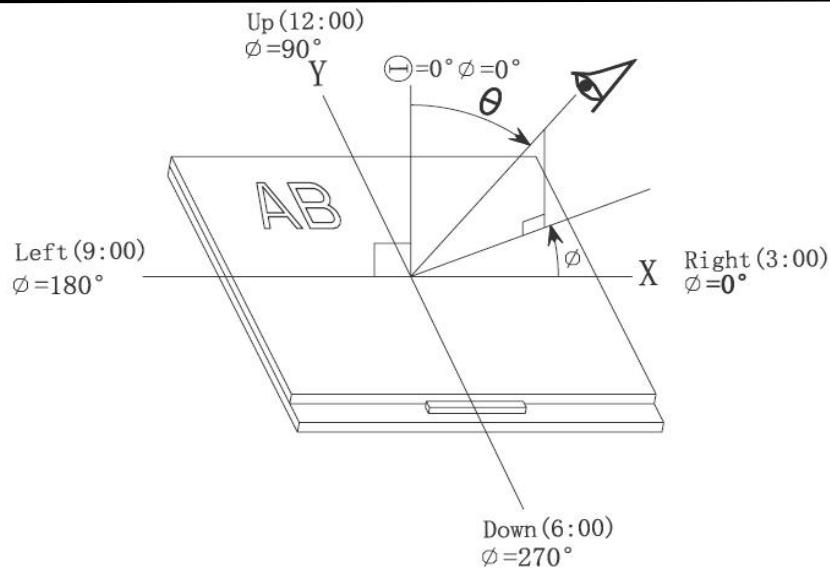

$B_p$  (Max.) = Maximum brightness in 9 measured spots

$B_p$  (Min.) = Minimum brightness in 9 measured spots.

Note 3: The definition of viewing angle:

Refer to the graph below marked by  $\theta$  and  $\Phi$

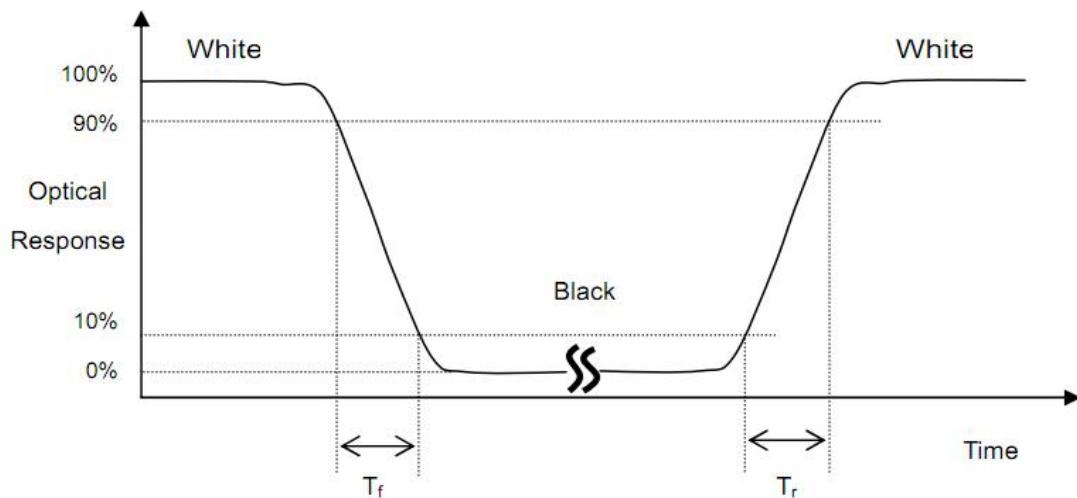

Note 4: Definition of contrast ratio

Contrast measurements shall be made at viewing angle of  $\Theta= 0$  and at the center of the LCD surface. Luminance shall be measured with all pixels in the view field set first to white, then to the dark (black) state.

$$CR = \frac{\text{Luminance when displaying a white raster}}{\text{Luminance when displaying a black raster}}$$

Note 5: Definition of Response time

The output signals of photo detector are measured when the input signals are changed from "white" to "black"(Tf) and from "black" to "white"(Tr), respectively. The response time is defined as the time interval between the 10% and 90% of amplitudes. Refer to figure as below.
